

The Zen of Laptop Stands

This is an actual size template of the side of a laptop stand. Cut this out and paste it on the wood. The angles shown will guide you in setting your miter gauge. I suggest putting wood for both sides together with double-sided tape, and cutting them both out at the same time.

The width of the stand is determined by the size of your laptop. People with very large laptops may need to make the base of the sides a little longer.

Please see the video for lots more details about both the design and construction.

Patrick Sullivan

This angle is 30 degrees. It may be too steep for many people.

This angle is 23 degrees. It will work for many people.

This angle is 18 degrees. This shallow angle will be widely acceptable..
